1. Ask the user to enter his name:

The prompt() method is used to display a dialog box in the browser that asks the user to enter his name. The value entered by the user is stored in the variable name.

2. Check if the user entered anything:

An if statement is used to check if the variable name contains any value (i.e. if the user entered anything at the prompt). If the user presses "OK" without typing anything or presses "Cancel", name will be an empty string ("") or null, respectively, which is considered "false" in JavaScript.

3. If the user entered a name:

If the if condition is true (i.e. if the user entered something), the code inside the if block is executed, displaying an alert with a custom message that greets the user by name. The alert() method displays a popup box with the message.

 4. If the user did not enter a name:

If the user did not enter any value, the else block is executed, displaying an alert with a generic greeting message.
